PHP Function handling Functions

call_user_func_array()

Call a callback with an array of parameters example

call_user_func()

Call the callback given by the first parameter example

create function()

Create an anonymous (lambda-style) function example

forward_static_call_array()

Call a static method and pass the arguments as array

example

forward_static_call()

By **krabat1** (krabat1) cheatography.com/krabat1/

Published 8th December, 2012. Last updated 12th December, 2012. Page 1 of 45.

by krabat1 (krabat1) via cheatography.com/2778/cs/706/

PHP Function handling Functions (cont)

Call a static method

example

func_get_arg()

Return an item from the argument list example

func_get_args()

Returns an array comprising a function's argument list

example

func_num_args()

Returns the number of arguments passed to the function

example

function_exists()

Return TRUE if the given function has been defined

example

get_defined_functions()

Returns an array of all defined functions example

register_shutdown_function()

Register a function for execution on shutdown

register_tick_function()

PHP Function handling Functions (cont)

Register a function for execution on each tick example

unregister_tick_function()

*De-register a function for execution on each tick example

PHP Operators

■ Operators

http://php.net/manual/en/language.operators.php

■ What does this symbol mean in PHP?

http://stackoverflow.com/questions/3737139/reference-what-does-this-symbol-mean-in-php

PHP Logical Operators

Exam ple	Name	Result
\$a and \$b	And	TRUE if both \$a and \$b are TRUE.
\$a or \$b	Or	TRUE if either \$a or \$b is TRUE.
\$a xor \$b	Xor	TRUE if either \$a or \$b is TRUE, but not both.
! \$a	Not	TRUE if \$a is not TRUE.
\$a && \$b	And	TRUE if both \$a and \$b are TRUE.
\$a \$b	Or	TRUE if either \$a or \$b is TRUE.

PHP Arithmetic Operators

Exampl e	Name	Result
-\$a	Negation	Opposite of \$a.
\$a + \$b	Addition	Sum of \$a and \$b.
\$a - \$b	Subtraction	Difference of \$a and \$b.
\$a * \$b	Multiplicatio n	Product of \$a and \$b.
\$a / \$b	Division	Quotient of \$a and \$b.

PHP Arithmetic Operators (cont)

\$a %	Modulus	Remainder of \$a divided
\$b		by \$b.

PHP Incrementing/Decrementing Operators

Exam ple	Name	Effect
++\$a	Pre- increment	Increments \$a by one, then returns \$a.
\$a++	Post- increment	Returns \$a, then increments \$a by one.
\$a	Pre- decremen t	Decrements \$a by one, then returns \$a.
\$a	Post- decremen t	Returns \$a, then decrements \$a by one.

PHP Bitwise Operators

Exam ple	Name	Result
\$a & \$b	And	Bits that are set in both \$a and \$b are set.
\$a \$b	Or (inclusive or)	Bits that are set in either \$a or \$b are set.
\$a ^ \$b	Xor (exclusive or)	Bits that are set in \$a or \$b but not both are set.
~ \$a	Not	Bits that are set in \$a are not set, and vice versa.
\$a << \$b	Shift left	Shift the bits of \$a \$b steps to the left (each step means "multiply by two")
\$a >> \$b	Shift right	Shift the bits of \$a \$b steps to the right (each step means "divide by two")

By **krabat1** (krabat1) cheatography.com/krabat1/

by krabat1 (krabat1) via cheatography.com/2778/cs/706/

PHP Com	parison Ope	erators
Example	Name	Result
\$a == \$b	Equal	TRUE if \$a is equal to \$b after type juggling.
\$a === \$b	Identical	TRUE if \$a is equal to \$b, and they are of the same type.
\$a != \$b	Not equal	TRUE if \$a is not equal to \$b after type juggling.
\$a <> \$b	Not equal	TRUE if \$a is not equal to \$b after type juggling.
\$a !== \$b	Not identical	TRUE if \$a is not equal to \$b, or they are not of the same type.
\$a < \$b	Less than	TRUE if \$a is strictly less than \$b.
\$a > \$b	Greater than	TRUE if \$a is strictly greater than \$b.
\$a <= \$b	Less than or equal to	TRUE if \$a is less than or equal to \$b.
\$a >= \$b	Greater than or equal to	TRUE if \$a is greater than or equal to \$b.
Compari son	with	Various Types
Type of Operand 1	Type of Operand 2	Result
null or string	string	Convert NULL to "", numerical or lexical comparison

PHP Com	parison Op	erators (cont)
bool or null	anything	Convert to bool, FALSE < TRUE
object	object	Built-in classes can define its own comparison, different classes are uncomparable, same class - compare properties the same way as arrays (PHP 4), PHP 5 has its own explanation
string, resource or number	string, resource or number	Translate strings and resources to numbers, usual math
array	array	Array with fewer members is smaller, if key from operand 1 is not found in operand 2 then arrays are uncomparable, otherwise - compare value by value (see following example)
array	anything	array is always greater
object	anything	object is always greater

PHP Math Functions
abs()
Absolute value
example
acos()
Arc cosine
example
acosh()
Inverse hyperbolic cosine
example
asin()
Arc sine
example
asinh()
Inverse hyperbolic sine
example
atan2()
Arc tangent of two variables
example
atan()
Arc tangent
example
atanh()
Inverse hyperbolic tangent

PHP Math Functions (cont)	PHP Math Functions (cont)	PHP Math Functions (cont)
example	decoct()	
	Decimal to octal	hexdec()
base_convert()	example	Hexadecimal to decimal
Convert a number between arbitrary bases		example
example	deg2rad()	
	Converts the number in degrees to the radian	hypot()
bindec()	equivalent	Calculate the length of the hypotenuse of a
Binary to decimal	example	right-angle triangle
example		example
	exp()	
ceil()	Calculates the exponent of e	is_finite()
Round fractions up	example	Finds whether a value is a legal finite number
example		example
	expm1()	
cos()	Returns exp(number) - 1, computed in a way	is_infinite()
Cosine	that is accurate even when the value of number	Finds whether a value is infinite
example	is close to zero	example
	example	
cosh()		is_nan()
Hyperbolic cosine	floor()	Finds whether a value is not a number
example	Round fractions down	example
	example	
decbin()		lcg_value()
Decimal to binary	fmod()	Combined linear congruential generator
example	Returns the floating point remainder (modulo)	example
	of the division of the arguments	
dechex()	example	log10()
Decimal to hexadecimal		Base-10 logarithm
example	getrandmax()	example
	Show largest possible random value	
	example

PHP XML Manipulation Functions	PHP XML Manipulation Functions (cont)	PHP XML Manipulation Functions (cont)
	example	
DOM		simplexml_load_string()
	libxml_set_external_entity_loader()	Interprets a string of XML into an object
dom_import_simplexml()	Changes the default external entity loader	example
Gets a DOMElement object from a	example	
SimpleXMLElement object		
example	libxml_set_streams_context()	XML PARSER
	Set the streams context for the next libxml	
DOM CONSTANTS	document load or write	utf8_decode()
http://php.net/manual/en/dom.constants.php	example	Converts a string with ISO-8859-1 characters
		encoded with UTF-8 to single-byte ISO-8859-1
	libxml_use_internal_errors()	example
LIBXML	Disable libxml errors and allow user to fetch	
	error information as needed	utf8_encode()
libxml_clear_errors()	example	Encodes an ISO-8859-1 string to UTF-8
Clear libxml error buffer		example
example	LIBXML CONSTANTS	
	http://php.net/manual/en/libxml.constants.php	xml_error_string()
libxml_disable_entity_loader()		Get XML parser error string
Disable the ability to load external entities		example
example	SIMPLEXML	
		xml_get_current_byte_index()
libxml_get_errors()	simplexml_import_dom()	Get current byte index for an XML parser
Retrieve array of errors	Get a SimpleXMLElement object from a DOM	example
example	node.	
	example	xml_get_current_column_number()
libxml_get_last_error()		Get current column number for an XML parser
Retrieve last error from libxml	simplexml_load_file()	example
	Interprets an XML file into an object	
	example

XML_ERROR_ASYNC_ENTITY (integer)

XML ERROR PARAM ENTITY REF

(integer)

XML_ERROR_UNDEFINED_ENTITY (integer)
XML_ERROR_RECURSIVE_ENTITY_REF

by krabat1 (krabat1) via cheatography.com/2778/cs/706/

PHP XML Manipulation Functions (cont)

XML_ERROR_BAD_CHAR_REF (integer) XML_ERROR_BINARY_ENTITY_REF

XML_ERROR_ATTRIBUTE_EXTERNAL_ENTI TY_REF (integer)

XML ERROR MISPLACED XML PI (integer) XML_ERROR_UNKNOWN_ENCODING (integer)

XML_ERROR_INCORRECT_ENCODING

XML_ERROR_UNCLOSED_CDATA_SECTIO

XML_ERROR_EXTERNAL_ENTITY_HANDLI NG (integer)

XML_OPTION_CASE_FOLDING (integer) XML_OPTION_TARGET_ENCODING (integer)

XML_OPTION_SKIP_TAGSTART (integer) XML_OPTION_SKIP_WHITE (integer)

XML_SAX_IMPL (string)

Holds the SAX implementation method. Can be libxml or expat.

PHP Network Functions

checkdnsrr()

Check DNS records corresponding to a given Internet host name or IP address example

closelog()

Close connection to system logger example

define_syslog_variables()

Initializes all syslog related variables example

dns check record()

Alias of checkdnsrr example

dns_get_mx()

Alias of getmxrr example

dns get record()

Fetch DNS Resource Records associated with a hostname

example

fsockopen()

Open Internet or Unix domain socket

connection

example

gethostbyaddr()

Get the Internet host name corresponding to a given IP address

example

gethostbyname()

Get the IPv4 address corresponding to a given Internet host name

example

gethostbynamel()

Get a list of IPv4 addresses corresponding to a given Internet host name

example

gethostname()

Gets the host name

PHP Network Functions (cont)

getmxrr()

Get MX records corresponding to a given Internet host name

example

getprotobyname()

Get protocol number associated with protocol name

example

getprotobynumber()

Get protocol name associated with protocol number

example

getservbyname()

Get port number associated with an Internet service and protocol

example

getservbyport()

Get Internet service which corresponds to port and protocol

example

header_register_callback()

Call a header function example

PHP Predefined Variables

Superglobals

Superglobals are built-in variables that are always available in all scopes Several predefined variables in PHP are

"superglobals", which means they are available in all scopes throughout a script. There is no need to do global \$variable; to access them within functions or methods.

These superglobal variables are:

\$GLOBALS

\$_SERVER

\$_GET

\$_POST

\$_FILES

\$_COOKIE

\$_SESSION

\$_REQUEST \$_ENV

\$GLOBALS

References all variables available in global scope

By **krabat1** (krabat1) cheatography.com/krabat1/

Published 8th December, 2012. Last updated 12th December, 2012. Page 12 of 45.

by krabat1 (krabat1) via cheatography.com/2778/cs/706/

PHP Predefined Variables (cont)

An associative array containing references to all variables which are currently defined in the global scope of the script. The variable names are the keys of the array.

example

\$_SERVER

Server and execution environment information

■ 8 useful server variables available in

PHP: http://cdv.lt/Hs

\$_SERVER['PHP_SELF']

The filename of the currently executing script, relative to the document root. For instance, \$_SERVER['PHP_SELF'] in a script at the address http://example.com/test.php/foo.bar would be /test.php/foo.bar. The __FILE__ constant contains the full path and filename of the current (i.e. included) file. If PHP is running as a command-line processor this variable contains the script name since PHP 4.3.0. Previously it was not available.

Array of arguments passed to the script. When the script is run on the command line, this gives C-style access to the command line parameters. When called via the GET method, this will contain the query string. 'argc'

Contains the number of command line parameters passed to the script (if run on the command line).

\$_SERVER['GATEWAY_INTERFACE']

PHP Predefined Variables (cont)

What revision of the CGI specification the server is using; i.e. 'CGI/1.1'.

\$_SERVER['SERVER_ADDR']

The IP address of the server under which the current script is executing.

\$_SERVER['SERVER_NAME']

The name of the server host under which the current script is executing. If the script is running on a virtual host, this will be the value defined for that virtual host.

\$_SERVER['SERVER_SOFTWARE']

Server identification string, given in the headers when responding to requests.

\$_SERVER['SERVER_PROTOCOL']

Name and revision of the information protocol via which the page was requested; i.e. 'HTTP/1.0';

\$_SERVER['REQUEST_METHOD']

Which request method was used to access the page; i.e. 'GET', 'HEAD', 'POST', 'PUT'.
Note:

PHP script is terminated after sending headers (it means after producing any output without output buffering) if the request method was HEAD.

\$ SERVER['REQUEST TIME']

The timestamp of the start of the request. Available since PHP 5.1.0.

PHP Predefined Variables (cont)

\$_SERVER['REQUEST_TIME_FLOAT']

The timestamp of the start of the request, with microsecond precision. Available since PHP 5.4.0.

\$_SERVER['QUERY_STRING']

The query string, if any, via which the page was accessed.

\$_SERVER['DOCUMENT_ROOT']

The document root directory under which the current script is executing, as defined in the server's configuration file.

\$_SERVER['HTTP_ACCEPT']

Contents of the Accept: header from the current request, if there is one.

\$_SERVER['HTTP_ACCEPT_CHARSET']

Contents of the Accept-Charset: header from the current request, if there is one. Example: 'iso-8859-1,,utf-8'.*

\$_SERVER['HTTP_ACCEPT_ENCODING']

Contents of the Accept-Encoding: header from the current request, if there is one. Example: 'gzip'.

\$_SERVER['HTTP_ACCEPT_LANGUAGE']

Contents of the Accept-Language: header from the current request, if there is one. Example: 'en'.

by krabat1 (krabat1) via cheatography.com/2778/cs/706/

PHP Predefined Variables (cont)

■ Detect Browser Language in PHP:

http://cdv.lt/l5

\$_SERVER['HTTP_CONNECTION']

Contents of the Connection: header from the current request, if there is one. Example: 'Keep-Alive'.

\$_SERVER['HTTP_HOST']

Contents of the Host: header from the current request, if there is one.

\$_SERVER['HTTP_REFERER']

The address of the page (if any) which referred the user agent to the current page. This is set by the user agent. Not all user agents will set this, and some provide the ability to modify HTTP_REFERER as a feature. In short, it cannot really be trusted.

\$_SERVER['HTTP_USER_AGENT']

Contents of the User-Agent: header from the current request, if there is one. This is a string denoting the user agent being which is accessing the page. A typical example is:

Mozilla/4.5 [en] (X11; U; Linux 2.2.9 i586).

Among other things, you can use this value with get_browser() to tailor your page's output to the capabilities of the user agent.

\$ SERVER['HTTPS']

Set to a non-empty value if the script was queried through the HTTPS protocol.

PHP Predefined Variables (cont)

Note: Note that when using ISAPI with IIS, the value will be off if the request was not made through the HTTPS protocol.

\$_SERVER['REMOTE_ADDR']

The IP address from which the user is viewing the current page.

\$_SERVER['REMOTE_HOST']

The Host name from which the user is viewing the current page. The reverse dns lookup is based off the REMOTE_ADDR of the user.

Note: Your web server must be configured to create this variable. For example in Apache you'll need HostnameLookups On inside httpd.conf for it to exist. See also gethostbyaddr().

\$_SERVER['REMOTE_PORT']

The port being used on the user's machine to communicate with the web server.

\$_SERVER['REMOTE_USER']

The authenticated user.

\$_SERVER['REDIRECT_REMOTE_USER']

The authenticated user if the request is internally redirected.

\$_SERVER['SCRIPT_FILENAME']

The absolute pathname of the currently executing script.

Note:

PHP Predefined Variables (cont)

If a script is executed with the CLI, as a relative path, such as file.php or ../file.php, \$_SERVER['SCRIPT_FILENAME'] will contain the relative path specified by the user.

\$ SERVER['SERVER ADMIN']

The value given to the SERVER_ADMIN (for Apache) directive in the web server configuration file. If the script is running on a virtual host, this will be the value defined for that virtual host.

\$_SERVER['SERVER_PORT']

The port on the server machine being used by the web server for communication. For default setups, this will be '80'; using SSL, for instance, will change this to whatever your defined secure HTTP port is.

\$_SERVER['SERVER_SIGNATURE']

String containing the server version and virtual host name which are added to servergenerated pages, if enabled.

\$_SERVER['PATH_TRANSLATED']

Filesystem- (not document root-) based path to the current script, after the server has done any virtual-to-real mapping.

By **krabat1** (krabat1) cheatography.com/krabat1/

Published 8th December, 2012. Last updated 12th December, 2012. Page 14 of 45.

by krabat1 (krabat1) via cheatography.com/2778/cs/706/

PHP Predefined Variables (cont)

Note: As of PHP 4.3.2, PATH_TRANSLATED is no longer set implicitly under the Apache 2 SAPI in contrast to the situation in Apache 1, where it's set to the same value as the SCRIPT_FILENAME server variable when it's not populated by Apache. This change was made to comply with the CGI specification that PATH_TRANSLATED should only exist if PATH_INFO is defined. Apache 2 users may use AcceptPathInfo = On inside httpd.conf to define PATH_INFO.

\$_SERVER['SCRIPT_NAME']

Contains the current script's path. This is useful for pages which need to point to themselves.

The __FILE__ constant contains the full path and filename of the current (i.e. included) file.

\$_SERVER['REQUEST_URI']

The URI which was given in order to access this page; for instance, '/index.html'.

\$_SERVER['PHP_AUTH_DIGEST']

When doing Digest HTTP authentication this variable is set to the 'Authorization' header sent by the client (which you should then use to make the appropriate validation).

\$_SERVER['PHP_AUTH_USER']

When doing HTTP authentication this variable is set to the username provided by the user.

\$ SERVER['PHP AUTH PW']

When doing HTTP authentication this variable is set to the password provided by the user.

PHP Predefined Variables (cont)

\$_SERVER['AUTH_TYPE']

When doing HTTP authenticated this variable is set to the authentication type.

\$ SERVER['PATH INFO']

Contains any client-provided pathname information trailing the actual script filename but preceding the query string, if available. For instance, if the current script was accessed via the URL

http://www.example.com/php/path_info.php/some/ stuff?foo=bar, then

\$_SERVER['PATH_INFO'] would contain /some/stuff.

\$ SERVER['ORIG PATH INFO']

Original version of 'PATH_INFO' before processed by PHP.

\$ GET

HTTP GET variables

\$_POST

HTTP POST variables

\$_FILES

HTTP File Upload variables

PHP Predefined Variables (cont

\$ REQUEST

HTTP Request variables

An associative array that by default contains the contents of \$_GET, \$_POST and

\$_COOKIE.

\$_SESSION

Session variables

An associative array containing session variables available to the current script. See the Session functions documentation for more information on how this is used.

Session functions:

http://php.net/manual/en/ref.session.php

\$ ENV

Environment variables

An associative array of variables passed to the current script via the environment method. These variables are imported into PHP's global namespace from the environment under which the PHP parser is running. Many are provided by the shell under which PHP is running and different systems are likely running different kinds of shells, a definitive list is impossible. Please see your shell's documentation for a list of defined environment variables.

by krabat1 (krabat1) via cheatography.com/2778/cs/706/

PHP Predefined Variables (cont)

\$_COOKIE

HTTP Cookies

An associative array of variables passed to the current script via HTTP Cookies.

\$php_errormsg

*The previous error message

\$php_errormsg is a variable containing the text of the last error message generated by PHP. This variable will only be available within the scope in which the error occurred, and only if the track_errors configuration option is turned on (it defaults to off).*

Note: This variable is only available when track_errors is enabled in php.ini.

Warning: If a user defined error handler (set_error_handler()) is set \$php_errormsg is only set if the error handler returns FALSE.

\$HTTP_RAW_POST_DATA

Raw POST data

\$HTTP_RAW_POST_DATA contains the raw POST data.

See always_populate_raw_post_data

http://php.net/manual/en/ini.core.php#ini.always-populate-raw-post-data

\$http_response_header

PHP Predefined Variables (cont)

HTTP response headers

The \$http_response_header array is similar to the <code>get_headers()</code> function. When using the HTTP wrapper, <code>\$http_response_header</code> will be populated with the HTTP response headers. <code>\$http_response_header</code> will be created in the <code>local scope</code>.

http://php.net/manual/en/wrappers.http.php http://php.net/manual/en/language.variables.scope. php

.....

\$argc

The number of arguments passed to script Contains the number of arguments passed to the current script when running from the command line.

Note: The script's filename is always passed as an argument to the script, therefore the minimum value of \$argc is 1.

Note: This variable is not available when register_argc_argv is disabled.

\$argv

Array of arguments passed to script

Contains an array of all the arguments passed to the script when running from the command line

Note: The first argument \$argv[0] is always the name that was used to run the script.

Note: This variable is not available when

register_argc_argv is disabled.

PHP Array Functions

array_change_key_case()

Changes all keys in an array

■ http://cdv.lt/Hn

array_chunk()

Split an array into chunks

■ http://cdv.lt/Ho

array_combine()

Creates an array by using one array for keys and another for its values

■ http://cdv.lt/Ht

array_count_values()

Counts all the values of an array

■ http://cdv.lt/Hv

array_diff_assoc()

Computes the difference of arrays with additional index check

■ http://cdv.lt/Hw

array_diff_key()

Computes the difference of arrays using keys for comparison

■ http://cdv.lt/Hx

array_diff_uassoc()

Computes the difference of arrays with additional index check which is performed by a user supplied callback function

PHP Array Functions (cont)

EXTR_REFS

PHP String Functions

addcslashes()

Quote string with slashes in a C style example

addslashes()

Quality in the second

Quote string with slashes example

bin2hex()

Convert binary data into hexadecimal

representation

example

chop()

Alias of rtrim

example

chr()

Return a specific character

example

chunk_split()

Split a string into smaller chunks

example

convert_cyr_string()

Convert from one Cyrillic character set to another

example

By **krabat1** (krabat1) cheatography.com/krabat1/

PHP String Functions (cont)

convert_uudecode()

Decode a uuencoded string

example

convert_uuencode()

Uuencode a string

example

count_chars()

Return information about characters used in a

example

.

crc32()

Calculates the crc32 polynomial of a string example

crypt()

One-way string hashing

example

echo()

Output one or more strings

■ http://cdv.lt/Hm

explode()

Split a string by string

example

PHP String Functions (cont)

fprintf(

Write a formatted string to a stream example

get_html_translation_table()

Returns the translation table used by htmlspecialchars and htmlentities example

hebrev()

Convert logical Hebrew text to visual text example

hebrevc()

Convert logical Hebrew text to visual text with newline conversion

example

hex2bin()

Decodes a hexadecimally encoded binary string

example

html_entity_decode()

Convert all HTML entities to their applicable characters

example

example

htmlentities()

Convert all applicable characters to HTML entities

example

checkdate()

Validate a Gregorian date example

date_add()

Alias of DateTime::add example

date_create_from_format()

Alias of DateTime::createFromFormat example

date_create()

Alias of DateTime::__construct example

date_date_set()

Alias of DateTime::setDate example

date_default_timezone_get()

Gets the default timezone used by all date/time functions in a script example

PHP Date/Time Functions (cont)

date_default_timezone_set()

Sets the default timezone used by all date/time functions in a script

example

date diff()

Alias of DateTime::diff example

date_format()

Alias of DateTime::format example

date_get_last_errors()

Alias of DateTime::getLastErrors example

date_interval_create_from_date_string()

Alias of DateInterval::createFromDateString example

date_interval_format()

Alias of DateInterval::format

example

date_isodate_set()

Alias of DateTime::setISODate example

date_modify()

Alias of DateTime::modify

PHP Date/Time Functions (cont)

example

date_offset_get()

Alias of DateTime::getOffset

example

date_parse_from_format()

Get info about given date formatted according to the specified format

example

date_parse()

Returns associative array with detailed info about given date example

date sub()

Alias of DateTime::sub example

date_sun_info()

Returns an array with information about sunset/sunrise and twilight begin/end example

date_sunrise()

Returns time of sunrise for a given day and location example

date_sunset()

PHP Calendar Functions

cal_days_in_month()

Return the number of days in a month for a

given year and calendar

example

cal_from_jd()

Converts from Julian Day Count to a supported

calendar

example

cal info()

Returns information about a particular calendar

example

cal_to_jd()

Converts from a supported calendar to Julian

Day Count

example

PATHINFO_BASENAME (integer)

PATHINFO EXTENSION (integer)

PATHINFO_FILENAME (integer)

Since PHP 5.2.0.

FILE_USE_INCLUDE_PATH (integer)

Search for filename in include_path (since PHP 5).

FILE_NO_DEFAULT_CONTEXT (integer)

FILE APPEND (integer)

Append content to existing file.

FILE_IGNORE_NEW_LINES (integer)

Strip EOL characters (since PHP 5).

FILE_SKIP_EMPTY_LINES (integer)

Skip empty lines (since PHP 5).

FILE BINARY (integer)

Binary mode (since PHP 5.2.7).

Note:

This constant has no effect, and is only available for forward compatibility.

FILE_TEXT (integer)

Page 37 of 45.

Text mode (since PHP 5.2.7).

Published 8th December, 2012. Last updated 12th December, 2012.

This constant has no effect, and is only available for forward compatibility.

INI SCANNER NORMAL (integer)

Normal INI scanner mode (since PHP 5.3).

INI_SCANNER_RAW (integer)

Raw INI scanner mode (since PHP 5.3).

FNM_NOESCAPE (integer)

Disable backslash escaping.

FNM_PATHNAME (integer)

Slash in string only matches slash in the given pattern.

FNM PERIOD (integer)

Leading period in string must be exactly matched by period in the given pattern.

FNM_CASEFOLD (integer)

Caseless match. Part of the GNU extension.

PHP Directory Functions

chdir()

Change directory example

chroot()

Change the root directory example

FILTER_FLAG_ALLOW_OCTAL (integer) Allow octal notation (0[0-7]+) in "int" filter.

FILTER_FLAG_ALLOW_HEX (integer)

Allow hex notation (0x[0-9a-fA-F]+) in "int" filter.

FILTER_FLAG_STRIP_LOW (integer)
Strip characters with ASCII value less than 32.

FILTER_FLAG_STRIP_HIGH (integer)

Strip characters with ASCII value greater than 127.

FILTER_FLAG_ENCODE_LOW (integer)

Encode characters with ASCII value less than 32.

FILTER_FLAG_ENCODE_HIGH (integer)

Encode characters with ASCII value greater than 127.

FILTER_FLAG_ENCODE_AMP (integer) *Encode &.*

FILTER_FLAG_NO_ENCODE_QUOTES (integer)

Don't encode ' and ".

FILTER_FLAG_EMPTY_STRING_NULL (integer)

PHP Filter Functions (cont)

(No use for now.)

FILTER_FLAG_ALLOW_FRACTION

(integer)

Allow fractional part in "number_float" filter.

FILTER_FLAG_ALLOW_THOUSAND

(integer)

Allow thousand separator (,) in "number_float" filter.

FILTER_FLAG_ALLOW_SCIENTIFIC

(integer)

Allow scientific notation (e, E) in "number_float" filter.

FILTER_FLAG_PATH_REQUIRED (integer)

Require path in "validate_url" filter.

FILTER_FLAG_QUERY_REQUIRED

(integer)

Require query in "validate_url" filter.

FILTER FLAG IPV4 (integer)

Allow only IPv4 address in "validate_ip" filter.

FILTER_FLAG_IPV6 (integer)

Allow only IPv6 address in "validate_ip" filter.

FILTER_FLAG_NO_RES_RANGE (integer)

Deny reserved addresses in "validate_ip" filter.

FILTER_FLAG_NO_PRIV_RANGE (integer)

PHP Filter Functions (cont

Deny private addresses in "validate_ip" filter.

PHP Misc Functions

connection_aborted

Check whether client disconnected example

connection status

Returns connection status bitfield example

connection_timeout

Check if the script timed out example

.....

constant

Returns the value of a constant example

define

Defines a named constant example

defined

Checks whether a given named constant exists example

die

Equivalent to exit example

eval

PHP Misc Functions (cont) PHP Misc Functions (cont) Evaluate a string as PHP code example exit Output a message and terminate the current script example get_browser Tells what the user's browser is capable of example __halt_compiler Halts the compiler execution example highlight file Syntax highlighting of a file example highlight_string Syntax highlighting of a string ignore_user_abort Set whether a client disconnect should abort script execution example pack Pack data into binary string

example
php_check_syntax Check the PHP syntax of (and execute) the specified file example
php_strip_whitespace Return source with stripped comments and whitespace example
show_source Alias of highlight_file example
sleep Delay execution example
sys_getloadavg Gets system load average example
time_nanosleep Delay for a number of seconds and nanoseconds example
time_sleep_until Make the script sleep until the specified time example
